

AISEE-BIN · Flower Dome field test

iPhone app (TestFlight build 10 or later). About 30 minutes on site. Everything you do uploads to the team automatically.

Before you start

- Update AISEE-BIN in **TestFlight**.
- Turn on **mobile data**: linking the scans needs internet.
- Use the **phone only** for steps 1–4. Leave the glasses off, or on the Glasses screen make sure **Use glasses for positioning** is off.
- Start at the **entrance (Point A)**.

1 Check the map

Open the app on the **Navigate** tab. The line under the status should say **Flower Dome v4 (latest)**, or a later version.

"Relocalizing..." and "Finding your position" are normal until you're on site.

If it shows a different map name, do step 2. Otherwise skip to step 3.

2 Choose Flower Dome (only if needed)

1. Tap the **Author** tab.
2. Tap **Open a map from the server**.
3. Choose **Flower Dome**.
4. Go back to **Navigate** and check that it now says Flower Dome.

Don't tap *Start scanning*: that would start a new map.

3 Open Field Test

On **Navigate**, tap the **...** button at the bottom right, then **Field Test...**

The **Glasses...** item in the same menu is where you turn glasses positioning on or off.

4 Link the scans: one slow walk

1. At the entrance, tap **Start walk**.
2. Walk the route **A → B → C → 1 → 2 → 3 → 4** slowly. Hold the phone up at chest height, pointing along the path.
3. Stop for about **10 seconds** at each point, especially through the doors and around Points 1–3.
4. Watch the scan list: each scan should get some *fixes*. If one stays at 0 near its area, pause there a little longer.
5. At Point 4, tap **Stop walk**. Scans should show *placed via ...* in green (one says *reference*).
6. Tap **Publish linked placements**.

If a scan says *not linked*, tap **Start again** and walk that stretch more slowly. Nothing is saved until you publish.

5 Mark the points

Walk the route again and wait until **Position** (at the top of Field Test) shows numbers. At each point (Point A, Door B, Door C, Flower Dome, Points 1–3, Bottle trees, Point 4):

1. Stand **exactly** on the spot.
2. Tap **Mark** and keep still for 5 seconds.

When you've marked them all, tap **Publish ... marks**, which appears below the list.

Marks are kept if you close the screen. If the map changes before you publish, they're cleared and you just mark again.

6 Accuracy checks (after publishing marks)

Marked points then appear under **3 · Accuracy check**. At each point, stand on the spot and tap **I'm here**. The app listens for 10 seconds and shows how far off it was.

- Do it once with the **phone alone**.
- Do it again with the **glasses**: connect them on the Glasses screen and turn on **Use glasses for positioning**.

Pressing the glasses' button anywhere on the route also says "where am I".

7 Send the log

At the bottom of Field Test, tap **Send log**. Please do this at the end even if something went wrong, and note roughly when it happened.
